

Setting and installing have never been simpler!

In the realizations section, we show to you the **WindPorts™** on top of a tower, with guy wires. Our customer, the City of Montreal whose idea was to diminish as much as possible the visual impact, created this unique installation in a highly tourist site. Obviously, this type of structure requires a crane for setting up.

We rather recommend the use of a lattice tower. This enables the setting without any crane. Thanks to a simple cable and 3 pulleys, just slide the **WindPorts™** inside its tower!

This concept also allows installing it on top of buildings.
